System 1 and System 2 Clinical Reasoning Performance by Block and Longitudinal Integrated Clerks in a Structured Clinical Oral Internal Medicine Clerkship Examination

Daniel Panisko MD MPH FRCPC, Edmund Lorens MEd, Sumitra Robertson BA Hons, Luke Devine MD MHPE FRCPC

Department of Medicine, Faculty of Medicine, University of Toronto; and the Centre for Excellence in Education and Practice, University Health Network, Toronto.
“Deciding on a diagnosis and instituting a treatment strategy are foundational to the practice of medicine. There is no question that developing competence in these processes, which are referred to loosely as “clinical reasoning” is essential for physician success.”
Background - Two Types of Clinical Reasoning (Croskerry, *Acad Med* 2009)

- Intuitive Approach (System 1)
- Analytical Approach (System 2)

45
Clinical reasoning and clinical decision making are skills that are perceived to be vital for the practice of medicine, but have received more emphasis at the postgraduate training level.

Assessment of medical student performance in these domains in high stakes clerkship examinations has not been widely reported.

Student ability in clinical reasoning at the clerkship level is not well understood and differences between Block and Longitudinal trained clerks have not been explored.
Background

- A Structured Clinical Oral (SCO) examination developed to examine, in part, clinical reasoning skills
- Consists of eight 9-minute stations
- In 3 stations, students interact one-on-one with examiners in structured case discussions that test Clinical Reasoning Skills around the diagnosis and/or management of a patient
A 66-year-old man presents to the Emergency Department with generalized malaise after having had severe watery diarrhea for 5 days during the past week. The diarrhea resolved completely 2 days ago but his malaise persists with some postural lightheadedness. The patient was entirely well before the onset of the diarrhea. The patient’s only past medical history was that of well treated hypertension for the past 20 years with Ramipril 10 mg po od.

The emergency physician has obtained the following basic bloodwork: CBC: Hb 165, WBC 8.2, Platelets 250; Serum Lytes: Na 146, K 4.3, Cl 111, HCO3 24, Creatinine: 320, Glucose: 6.6. The CBC, electrolytes and creatinine were all known to be normal 1 month ago during a visit to the family MD. You see the patient after the Emergency Department physician refers him for the evaluation of the elevated creatinine.

Please anticipate being asked about history, physical examination findings, and investigations needed to reach a diagnosis.
Background – Sample Questions

System 1 (Intuitive):
“What is the most likely diagnosis?”
Acute kidney injury due to volume contraction secondary to diarrhea

System 2 (Analytical):
“What is the differential diagnosis?”
Glomerulonephritis, Acute interstitial nephritis, Obstructive Uropathy

Global:
G3. Integration & Analysis of Data (Problem Solving)
Background – Structured Clinical Oral Examination

Assessment Scheme: Internal Medicine Clerkship

- Structured Clinical Oral Examination 25%
- Written Examination 30%
- Work-Based Ward Assessment 30%
- Work-Based Ambulatory Clinic Assessment 10%
- Evidence Based Medicine Assessment 5%
Objectives

- Determine how student performance on the Clinical Reasoning portion of their examination correlated to and compared with their performance on the other components of the clerkship assessment scheme.
- Determine student performance in Type 1 (intuitive) and Type 2 (analytical) Clinical Reasoning tasks and how these correlated with performance on the other components of the clerkship assessment scheme.
- Compare Clinical Reasoning performance between Block and Longitudinally trained clinical clerks.
Methods (1)

- Simple descriptive statistics of student performance in components of the SCO (the 3 Clinical Reasoning Stations alone, and the total SCO performance) and other assessment modalities were computed for all students taking the “C” clerkship rotation exams in the academic years 2014-15 and 2015-16 (N = 27 LIC, and N = 48 Block clerks)

- Pearson correlation coefficients were calculated to examine the relationship between student performance in the Clinical Reasoning SCO stations and each of: student written examination performance, ward performance, and ambulatory clinic performance
Methods (2)

- Further descriptive statistics for student performance in Type 1 (intuitive pattern recognition) tasks, in Type 2 (analytical) tasks, and on Global Rating Scales of Clinical Reasoning, were calculated.

- T-tests were used to assess for differences between LIC clerks and Block clerks.

- Pearson correlation coefficients were calculated to examine the relationship between students’ performance in these components and the traditional assessment domains.
# Results - Mean Marks Achieved in Assessment Components of the Internal Medicine Clerkship

Conclusions

- LIC clerks outperformed Block clerks on all assessment modalities over 2 years in the Internal Medicine clerkship (but NS)
- Performances on CR domains LIC also better than Block but only System 2 reasoning ($p<.01$)
- LIC clinical clerk performance in assessments of Clinical Reasoning correlated best with overall performance on the rotation ($r = .752$) and performance on the written examination ($r = .650$)
Conclusions

- **Block** clinical clerk performance in assessments of Clinical Reasoning also correlated best with overall performance on the rotation ($r = .598$) and performance on the written examination ($r = .445$).

- Performance in System 2 analytical reasoning was the major difference between LIC and Block clerks.
  - LIC clerks were better than block clerks in this modality ($p<.01$).
  - There was poor correlation with this modality and written exam performance ($r = .082$), a major marker for knowledge.

- This suggests that LIC clerks of all knowledge capabilities are better at analytical clinical reasoning, and may make better use of this technique whether they are more or less knowledgeable than their peers.
Conclusions

- Type 1 (intuitive) Clinical Reasoning appeared to correlate strongly with overall clerkship performance and written examination performance.
- Type 2 (analytical) Clinical Reasoning correlated poorly with the other assessment components. This may indicate that this domain measures a separate and unique ability. Students who displayed relative increased strength in this domain may, indeed, be resorting to analytical thinking as a fall back strategy. They appear to be weaker overall and appear to not do as well in the other assessment components.
